

## Special subgraphs

*Definition:* (pp. 20,34) Let  $G$  be a graph.

A subgraph  $H$  is **spanning** if  $H$  contains all of  $G$ 's vertices.

## Special subgraphs

*Definition:* (pp. 20,34) Let  $G$  be a graph.

A subgraph  $H$  is **spanning** if  $H$  contains all of  $G$ 's vertices.

- ▶ If  $H$  is spanning and also a tree,  $H$  is called a **spanning tree**.

## Special subgraphs

*Definition:* (pp. 20,34) Let  $G$  be a graph.

A subgraph  $H$  is **spanning** if  $H$  contains all of  $G$ 's vertices.

- ▶ If  $H$  is spanning and also a tree,  $H$  is called a **spanning tree**.
- ▶ If  $H$  is spanning and also  $r$ -regular, then  $H$  is called an  $r$ -**factor**.  
A 1-factor is also called a **perfect matching**.

## Special subgraphs

*Definition:* (pp. 20,34) Let  $G$  be a graph.

A subgraph  $H$  is **spanning** if  $H$  contains all of  $G$ 's vertices.

- ▶ If  $H$  is spanning and also a tree,  $H$  is called a **spanning tree**.
- ▶ If  $H$  is spanning and also  $r$ -regular, then  $H$  is called an  **$r$ -factor**.  
A 1-factor is also called a **perfect matching**.

For a graph  $G$  to have a perfect matching, \_\_\_\_\_.

$$\bigcup_{1 \leq i \leq k} H_i = G \text{ and } E(H_i) \cap E(H_j) = \emptyset.$$

**Definition:** An  **$H$ -decomposition** is a decomposition of  $G$  such that each subgraph  $H_i$  in the decomposition is isomorphic to  $H$ .

## Perfect Matching Decomposition

*Definition:* A **perfect matching decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a perfect matching.

## Perfect Matching Decomposition

*Definition:* A **perfect matching decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a perfect matching.

*Theorem:* For a  $k$ -regular graph  $G$ ,  
 $G$  has a perfect matching decomposition if and only if  $\chi'(G) = k$ .

## Perfect Matching Decomposition

*Definition:* A **perfect matching decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a perfect matching.

*Theorem:* For a  $k$ -regular graph  $G$ ,  
 $G$  has a perfect matching decomposition if and only if  $\chi'(G) = k$ .

*Proof:*

There exists a decomposition of  $G$  into a set of  $k$  perfect matchings.

There exists a coloring of the edges of  $G$  where each vertex is incident to edges of each of  $k$  different colors.

## Perfect Matching Decomposition

*Definition:* A **perfect matching decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a perfect matching.

*Theorem:* For a  $k$ -regular graph  $G$ ,  
 $G$  has a perfect matching decomposition if and only if  $\chi'(G) = k$ .

*Proof:*

There exists a decomposition of  $G$  into a set of  $k$  perfect matchings.

There exists a coloring of the edges of  $G$  where each vertex is incident to edges of each of  $k$  different colors.

$$\chi'(G) = k$$

## Perfect Matching Decomposition

*Definition:* A **perfect matching decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a perfect matching.

*Theorem:* For a  $k$ -regular graph  $G$ ,  
 $G$  has a perfect matching decomposition if and only if  $\chi'(G) = k$ .

*Proof:*

There exists a decomposition of  $G$  into a set of  $k$  perfect matchings.

There exists a coloring of the edges of  $G$  where each vertex is incident to edges of each of  $k$  different colors.

$$\chi'(G) = k$$

*Corollary:*  $K_{2n+1}$  has a perfect matching decomposition.

*Corollary:* A snark has no perfect matching decomposition.

# Hamiltonian Cycles

*Definition:* A **Hamiltonian cycle**  $C$  in a graph  $G$  is a cycle containing every vertex of  $G$ .

*Definition:* A **Hamiltonian path**  $P$  in a graph  $G$  is a path containing every vertex of  $G$ .

# Hamiltonian Cycles

*Definition:* A **Hamiltonian cycle**  $C$  in a graph  $G$  is a cycle containing every vertex of  $G$ .

*Definition:* A **Hamiltonian path**  $P$  in a graph  $G$  is a path containing every vertex of  $G$ .

*Theorem:* If  $G$  has a Ham'n cycle, then  $G$  has a Ham'n path.

*Proof:*

# Hamiltonian Cycles

*Definition:* A **Hamiltonian cycle**  $C$  in a graph  $G$  is a cycle containing every vertex of  $G$ .

*Definition:* A **Hamiltonian path**  $P$  in a graph  $G$  is a path containing every vertex of  $G$ .

*Theorem:* If  $G$  has a Ham'n cycle, then  $G$  has a Ham'n path.

*Proof:*

An arbitrary graph may or may not contain a Hamiltonian cycle/path. This is very hard to determine in general!

★ Important: Paths and cycles do not use any vertex or edge twice. ★

# Hamiltonian Cycles

*Theorem 2.3.5:* A snark has no Hamiltonian cycle.

# Hamiltonian Cycles

*Theorem 2.3.5:* A snark has no Hamiltonian cycle.

*Fact:* A snark has an even number of vertices.

*Proof:* Suppose that a graph  $G$  is a snark and contains a Hamiltonian cycle. That is,  $G$  contains  $C$ , visiting each vertex once.

# Hamiltonian Cycles

*Theorem 2.3.5:* A snark has no Hamiltonian cycle.

*Fact:* A snark has an even number of vertices.

*Proof:* Suppose that a graph  $G$  is a snark and contains a Hamiltonian cycle. That is,  $G$  contains  $C$ , visiting each vertex once. Remove the edges of  $C$ ; what remains?

# Hamiltonian Cycles

*Theorem 2.3.5:* A snark has no Hamiltonian cycle.

*Fact:* A snark has an even number of vertices.

*Proof:* Suppose that a graph  $G$  is a snark and contains a Hamiltonian cycle. That is,  $G$  contains  $C$ , visiting each vertex once. Remove the edges of  $C$ ; what remains?

Consider the coloring of  $G$  where the remaining edges are colored yellow and the edges in the cycle are colored alternating between blue and red. This is a proper 3-edge-coloring of  $G$ , a contradiction.

# Hamiltonian Cycles

*Theorem 2.3.5:* A snark has no Hamiltonian cycle.

*Fact:* A snark has an even number of vertices.

*Proof:* Suppose that a graph  $G$  is a snark and contains a Hamiltonian cycle. That is,  $G$  contains  $C$ , visiting each vertex once. Remove the edges of  $C$ ; what remains?

Consider the coloring of  $G$  where the remaining edges are colored yellow and the edges in the cycle are colored alternating between blue and red. This is a proper 3-edge-coloring of  $G$ , a contradiction.

*The converse is not true!*

*Example:* Book Figure 2.3.4.

## Cycle Decompositions

*Definition:* A **cycle decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a cycle.

## Cycle Decompositions

*Definition:* A **cycle decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a cycle.

*Theorem:* Let  $G$  be a graph that has a cycle decomposition. Then every vertex of  $G$  has even degree.

## Cycle Decompositions

*Definition:* A **cycle decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a cycle.

*Theorem:* Let  $G$  be a graph that has a cycle decomposition. Then every vertex of  $G$  has even degree.

*Proof:* In the cycle decomposition, each cycle  $H_i$  contributes two to the degree of each of its vertices. For a vertex  $v$  in  $G$ , its degree is the sum of its degree over all subgraphs  $H_i$ , which must be even.

## Cycle Decompositions

*Definition:* A **cycle decomposition** is a decomposition such that each subgraph  $H_i$  in the decomposition is a cycle.

*Theorem:* Let  $G$  be a graph that has a cycle decomposition. Then every vertex of  $G$  has even degree.

*Proof:* In the cycle decomposition, each cycle  $H_i$  contributes two to the degree of each of its vertices. For a vertex  $v$  in  $G$ , its degree is the sum of its degree over all subgraphs  $H_i$ , which must be even.

*Definition:* A **Hamiltonian cycle decomposition** is a decomposition such that each subgraph  $H_i$  is a Hamiltonian cycle.

*Question:* Which graphs have a Hamiltonian cycle decomposition?  
Which complete graphs?

# Hamiltonian Cycle Decomposition

*Example:*  $K_7$  has a Hamiltonian cycle decomposition.

# Hamiltonian Cycle Decomposition

*Example:*  $K_7$  has a Hamiltonian cycle decomposition.

*Example:*  $K_{11}$  has a Hamiltonian cycle decomposition.

# Hamiltonian Cycle Decomposition

*Example:*  $K_7$  has a Hamiltonian cycle decomposition.

*Example:*  $K_{11}$  has a Hamiltonian cycle decomposition.

*However:* This construction does not work with  $K_9$ .

# Hamiltonian Cycle Decomposition

**Theorem 2.3.1:**  $K_{2n+1}$  has a Hamiltonian cycle decomposition.

**Proof:** This proof uses another instance of a “turning trick”. Place vertices  $0$  through  $2n$  in a circle and draw a zigzag path visiting all the vertices in the circle.

# Hamiltonian Cycle Decomposition

**Theorem 2.3.1:**  $K_{2n+1}$  has a Hamiltonian cycle decomposition.

**Proof:** This proof uses another instance of a “turning trick”. Place vertices  $0$  through  $2n$  in a circle and draw a zigzag path visiting all the vertices in the circle. Connect the ends of the path to vertex  $x$  to form a Ham. cycle.

# Hamiltonian Cycle Decomposition

**Theorem 2.3.1:**  $K_{2n+1}$  has a Hamiltonian cycle decomposition.

**Proof:** This proof uses another instance of a “turning trick”.

Place vertices  $0$  through  $2n$  in a circle and draw a zigzag path visiting all the vertices in the circle. Connect the ends of the path to vertex  $x$  to form a Ham. cycle. As you rotate the zigzag path  $n$  times, you visit each edge of  $K_{2n+1}$  once to form a Ham'n cycle decomposition.

# Hamiltonian Cycle Decomposition

**Theorem 2.3.1:**  $K_{2n+1}$  has a Hamiltonian cycle decomposition.

**Proof:** This proof uses another instance of a “turning trick”.

Place vertices 0 through  $2n$  in a circle and draw a zigzag path visiting all the vertices in the circle. Connect the ends of the path to vertex  $x$  to form a Ham. cycle. As you rotate the zigzag path  $n$  times, you visit each edge of  $K_{2n+1}$  once to form a Ham'n cycle decomposition.

As a corollary:

**Theorem 2.3.3:**  $K_{2n}$  has a Hamiltonian path decomposition.
