## Pascal's triangle

Pascal's identity gives us the recurrence $\binom{n}{k}=\binom{n-1}{k}+\binom{n-1}{k-1}$. With initial conditions we can calculate $\binom{n}{k}$ for all $n$ and $k$. $\binom{n}{0}=1$ and $\binom{n}{n}=1$ for all $n$.

| $n \backslash^{k}$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 |  |  |  |  |  |  |  |
| 1 | 1 | 1 |  |  |  |  |  |  |

## Binomial Theorem

Theorem 2.2.2. Let $n$ be a positive integer. For all $x$ and $y$,

$$
(x+y)^{n}=x^{n}+\binom{n}{1} x^{n-1} y+\cdots+\binom{n}{n-1} x y^{n-1}+y^{n} .
$$

Rewrite in summation notation!
Determine the generic term $\left[\begin{array}{l}n \\ k\end{array}\right) x$ y $\quad$ ] and the bounds on $k$

$$
(x+y)^{n}=\sum
$$

- The entries of Pascal's triangle are the coefficients of terms in the expansion of $(x+y)^{n}$.

Proof. In the expansion of $(x+y)(x+y) \cdots(x+y)$, in how many ways can a term have the form $x^{n-k} y^{k}$ ?
From the $n$ factors $(x+y)$, you must choose a " $y$ " exactly $k$ times.
Therefore, $\binom{n}{k}$ ways. We recover the desired equation.
