

# Connectivity Definitions and Theorems from Weeks 3 and 4

## February 13

### Connectivity Definitions:

**Definition:** A graph  $G$  is connected if for all  $v, w \in V(G)$ , there exists a path from  $v$  to  $w$ .

**Definition:**  $G$  is disconnected if  $G$  is not connected.

**Definition:** A (connected) component  $H$  is a MAXIMAL subgraph  $H$  of  $G$  that is connected.

**Definition:**  $G$  is  $k$ -connected if  $|V(G)| > k$  and removing fewer than  $k$  vertices does not disconnect the graph.

(We say that every graph is 0-connected.)

**Definition:** The connectivity of  $G$  (denoted  $\kappa(G) = \text{“kappa”}$ ) is the maximum  $k$  such that  $G$  is  $k$ -connected.

(Conventions: The connectivity of a single vertex is zero and  $\kappa(K_n) = n - 1$ .)

**Definition:** A cut vertex is a vertex  $v \in V(G)$  such that  $G \setminus v$  is disconnected.

**Definition:** A SEPARATING SET or vertex cut is a set of vertices  $X \subset V(G)$  such that  $G \setminus X$  is disconnected.

**Note:**  $\kappa(G) = 0 \iff G$  is disconnected or  $G$  is a single vertex

**Note:**  $\kappa(G) \geq 2 \iff G$  has no cut vertex.

### Edge Connectivity Definitions:

**Definition:**  $G$  is  $k$ -edge-connected if removing fewer than  $k$  edges does not disconnect the graph.

(We say that every graph is 0-edge-connected.)

**Definition:** The edge connectivity of  $G$  (denoted  $\lambda(G) = \text{“lambda”}$  or  $\kappa'(G)$ ) is the maximum  $k$  such that  $G$  is  $k$ -edge connected.

**Definition:** A bridge is an edge  $e \in E(G)$  such that  $G \setminus e$  is disconnected.

**Definition:** A DISCONNECTING SET is a set of edges  $D \subset E(G)$  such that  $G \setminus D$  is disconnected.

**Note:**  $\lambda(G) = 0 \iff G$  is disconnected.

**Note:**  $\lambda(G) \geq 2 \iff G$  has no bridge.

## February 15

**Note:** If you delete a cut vertex from a graph, the number of connected components increases.

**Note:** If you delete a bridge from a graph, the number of connected components increases by exactly one.

Theorems:

**Theorem:** (Book 2.4.1) Let  $G$  be connected. Then  $G$  is a tree  $\iff$  Every edge of  $G$  is a bridge.

**Theorem:** (Book 3.2.1) A regular graph of even degree has no bridge.

**Theorem:** For all graphs  $G$ ,  $\lambda(G) \leq \delta(G)$ .

Edge Cuts: [not to be confused with cutset or cut vertex]

**Definition:** Let  $X \subset V(G)$ . Then  $X^c$  is the complement of  $X$ .

That is,  $V(G) = X \cup X^c$  and  $X \cap X^c = \emptyset$ .

**Definition:** For any  $X \subset V(G)$  such that  $X, X^c \neq \emptyset$ , an edge cut (denoted  $[X, X^c]$ ) is the set of edges  $D$  between  $X$  and  $X^c$ .

**Note:** An edge cut is a disconnecting set, but not vice versa.

(This implies  $\lambda(G) \leq |[X, X^c]|$  for all  $X \subset V(G)$ .)

**Note:** A minimal disconnecting set is an edge cut, but not vice versa.

**Theorem:** For all graphs  $G$ ,  $\kappa(G) \leq \lambda(G)$ .

## February 18

Blocks:

**Definition:** A block of a graph  $G$  is a maximally connected subgraph of  $G$  with no cut vertex.

**Note:** The following things are true about blocks.

1.  $G$  itself may be a block.
2. Except for blocks that are edges, blocks are always 2-connected.
3. Any two blocks share at most one vertex.
4. A vertex shared between blocks is a cut vertex of  $G$ .
5. The blocks of  $G$  partition  $E(G)$ .

**Definition:** The block graph of  $G$  is a bipartite graph  $H$  with vertices  $v_i$  representing cut vertices of  $G$ , and vertices  $b_j$  representing blocks of  $G$ , where  $v_i b_j$  is an edge of  $H$  if vertex  $v_i$  is a vertex in block  $b_j$ .

**Note:** A block graph is always a forest. (Proof in hwk.)

More Graph Statistics:

**Definition:** An independent set of a graph  $G$  is a subset  $X \subset V(G)$  such that no edge of  $G$  connects any two vertices of  $X$ . In other words, the induced subgraph of  $G$  on  $X$  contains no edges.

**Definition:** The independence number of a graph  $G$  is the size of the maximum independence set of  $G$ . It is denoted  $\alpha(G)$ .

**Definition:** A vertex cover of a graph  $G$  is a subset  $X \subset V(G)$  such that  $X$  contains (at least) one endpoint of every edge in  $G$ .

**Definition:** The size of the smallest vertex cover is denoted  $\beta(G)$ .

**Theorem:** In any graph  $G$ ,  $X \subset V(G)$  is an independent set  $\iff X^c$  is a vertex cover.

**Theorem:** For all graphs  $G$ ,  $\alpha(G) + \beta(G) = |V(G)|$ .

**Note:** Finding an independent set  $X$  and a vertex cover  $Y$  such that  $|X| + |Y| = |V(G)|$  implies that  $\alpha(G) = |X|$  and  $\beta(G) = |Y|$ .

**Definition:** The clique number  $\omega(G)$  of a graph  $G$  is the largest number  $k$  such that  $K_k$  is a subgraph of  $G$ .

## February 20

Characterization of 2-connectedness:

**Theorem:** (Whitney, 1932 aka MINI-Menger) Let  $G$  be a graph with  $\geq 3$  vertices. Then  $G$  is 2-connected  $\iff$  for all  $v, w \in V(G)$ , there exist two internally disjoint  $v, w$ -paths in  $G$ .

**Theorem:** (Menger)  $G$  is  $k$ -connected  $\iff$  for all  $v, w \in V(G)$ , there exist  $k$  internally disjoint  $v, w$ -paths in  $G$ .

**Definition:** Let  $H$  be any subgraph of  $G$ . Then an  $H$ -path (or an ear) is a path in  $G$  that starts and ends in  $H$ .

**Definition:** An ear decomposition is a construction of  $G$  starting with some cycle  $C$ , and at each step successively adding to the existing graph  $H$  some  $H$ -path.

**Theorem:**  $G$  is 2-connected  $\iff G$  has an ear decomposition.

**Theorem:** Let  $G$  be a graph with  $\geq 3$  vertices. The following are equivalent:

1.  $G$  is 2-connected.
2.  $G$  is connected and has no cut vertex.
3.  $G$  is a block.
4. For all  $v, w \in V(G)$ , there exist two internally disjoint  $v, w$ -paths in  $G$ .
5. For all  $v, w \in V(G)$ , there exists a cycle in  $G$  through  $v$  and  $w$ .
6.  $\delta(G) > 0$  and for all  $e, f \in E(G)$ , there exists a cycle in  $G$  through  $e$  and  $f$ .
7.  $G$  has an ear decomposition.
